Delayed and Immediate Effects as well as Chronic Effects from Short and Long-term Exposure
Carcinogenicity

Wood dust has been classified by the International Agency for Research on Cancer (IARC) as "carcinogenic to humans" (Group 1) and "known to be a human carcinogen" by the National Toxicology Program (NTP). This classification is based primarily on increased risk in the occurrence of adenocarcinomas of the nasal cavities and paranasal sinuses associated with exposure to wood dust. The physical form of this product is such that no exposure to respirable wood dust is likely under normal use conditions, therefore the risk of adverse health effects is minimal.
